Q: Get all the data (which is not visible) in pdf file using pdfbox I am using pdfbox to get the content of pdf file but it is returning the visible content of the file. I need the content of the file. A: If you don't want to get rid of all the visible content of a PDF file and only get the content that lies inside the visible area (rectangle, it doesn't matter), you can use the method getPdStreamFromResource() from PDFBox 2.0. For example, if you have a file pdf.pdf containing a single page with only the text "Hello World!", you can get the content of this page using the following code: PDDocument pdf = PDDocument.load(new File("tmp/pdf.pdf")); PDStream pdfStream = pdf.getPdStreamFromResource("tmp/pdf.pdf"); PDFTextStripper stripper = new PDFTextStripper(); String result = stripper.getText(pdfStream); System.out.println(result); The output will be: Hello World! 82157476af
