□ Windows Server is a new operating system for small and midsize businesses (SMB) that enables you to deliver the latest software, collaborative solutions, and processes on a single, affordable Windows platform. Windows Server 2008 delivers core enterprise capabilities in the new datacenter, including features for managing and deploying mission-critical applications, virtualization, email, networking, and distributed processing. Windows Server 2008's technology-rich installation package includes a pre-built

---

edition that is optimized for Oracle Solaris, and can be used as an installable appliance that does not require a full virtualization host, hence making the installation process more economical.

**Windows Server 2008 and Windows Server 2008 Datacenter Edition Security**

The following is a list of security features and enhancements that are included in Windows Server 2008 and Windows Server 2008 Datacenter Edition. These features are based on suggestions from the software development and consulting community in conjunction with the Global Security Team. They also align the Server 2008 product offering with the strategy of other Microsoft products and services, including the Windows Vista operating system, System Center and Active Directory. For a complete list of security features, see the Microsoft Windows Server 2008 Security Guide. \*

**Windows Authentication Extensions:**

Windows Authentication is available with

---

Desktop, Terminal Services, and Remote Desktop Services in Server 2008. Windows Authentication enables you to secure user access to your network by requiring users to be authenticated against the network using a Microsoft account or domain account. Windows Authentication is also available with anonymous logons. \*

**Improved User Experience:** Permissions can be easily configured from the properties of the User Account Control (UAC) dialog and Directory Security dialog. Control-level access and the ability to add permissions at the user level are now supported. \*

**Improved Processes:** Processes are now more secure by being able to manage processes run by the current user, privileged users, and other users. You can also manage process settings such as the maximum number of threads and maximum memory. \*

**Improved Security for the Local Administrator Accounts:** The default

---

administrator accounts, built-in accounts, and guest accounts now have different security properties and are protected differently.

- \* Better Access Control: ACLs with the System namespace are available for all files and folders as well as Microsoft registry keys. Access control can be established on a per user, group, or computer basis. You can also restrict access to files and folders at the container level.
- \* Credential Guard: Windows Server 2008 has support for Single Sign On (SSO) across multiple different computing environments such as remote
